COMBINED UNCERTAINTY ANALYSIS REPORT
Triple Power Law Parameter Uncertainties
==

MODEL: logMacc = a×logAge + b×logMstar + c

PARAMETER DISTRIBUTIONS:
Age exponent (a) ~ N(μ=-0.410, σ=0.049)
Mass exponent (b) ~ N(μ=1.137, σ=0.108)
Amplitude (c) ~ N(μ=-5.623, σ=0.541)

UNCERTAINTY QUANTIFICATION:
Age exponent: ±0.049 (11.9% relative)
Mass exponent: ±0.108 (9.5% relative)
Amplitude: ±0.541 (9.6% relative)

MODEL INTERPRETATION:
• Accretion rate decreases by 0.410 in logMacc per logAge
• Higher mass stars accrete 3.12x more per mass decade
• Individual stars show 0.541 dex intrinsic scatter

STATISTICAL VALIDATION:
Bootstrap iterations: 500
Parameter consistency (KS tests):
  Age exponent: p = 0.368
  Mass exponent: p = 0.832
  Amplitude: p = 0.000
